

System Description

You are required to build an Employee Management System that manages:

Employees

Departments

Each employee belongs to one department, and each department can have many employees (1:N relationship).

Requirements

1. Database Design

Create a database with:

Employees table

Departments table

Proper relationship (Foreign Key)

2. Data Retrieval (Query)

A. Multiple Rows

Retrieve all employees

Display their basic information

B. Single Row

Retrieve a single employee by ID

Handle case when employee does not exist

◆ 3. Scalar Query

Get total number of employees

Get highest salary

Get average salary

◆ 4. Data Manipulation (Execute)

Implement the following operations:

Insert a new employee

Update employee salary

Delete employee

Each operation should confirm whether it succeeded or not.

◆ 5. Relationship Handling (Multi-Mapping)

Retrieve employees along with their department data

Display employee name + department name

Ensure correct mapping between both entities

◆ 6. Stored Procedures

Create and use stored procedures for:

Insert employee

Retrieve all employees

You must call these procedures from your application instead of writing raw queries.
